Waiting Rooms

... Provide sound, and preserve the quiet.
... Allow multimedia in difficult areas.

Multimedia in waiting areas presents a particular challenge for A/V installers. Some guests want to hear the sound, and some prefer to read or wait in quiet. The staff rarely want to hear the repetitive sound coming from installed displays, and are known to turn it off if the sound becomes bothersome. The owners know a peaceful, serene environment pleases customers most, and makes them want to come back.

Photographs courtesy eyeMaginations

eyeMaginations and iPort Media, leading providers of multimedia solutions to the eyecare industry, approached us citing these very problems with traditional loudspeaker systems. They recognized that if the sound from their education and advertisement systems could be controlled, doctors would be more inclined to add these systems to their offices. They were right – our Audio Spotlight systems are now a popular accessory favored by doctors and patients alike.

Mounted against the ceiling above the listening area, and connected directly to the host PC (or DVD), the thin, flat Audio Spotlight discs deliver sound for those who want it, and preserve the quiet for everyone else.
